Part I

Math 1

The Isosceles Triangle Theorem

Proofs.

Problem 1 Prove that the base angles of an isosceles triangle are congruent.

- Beginning with the given figure on the left, Morgan draws \overline{CD} and marks the figure intending that this new segment is a(n) (median/ angle bisector / perpendicular bisector/ altitude).
- Based on the marked figure, Morgan claims that the $\triangle ACD \cong \triangle \boxed{?}$ by (SAS/ SSS/ SSA/ ASA/ HL).
- Finally, Morgan concludes that $\angle A \cong \angle \boxed{?}$, as they are corresponding parts of congruent triangles.

Problem 2 Prove that the base angles of an isosceles triangle are congruent.

Author(s): Brad Findell

The Isosceles Triangle Theorem

- (a) Beginning with the given figure on the left, Deja draws \overline{CD} and marks the figure intending that this new segment is a(n) (median / angle bisector / perpendicular bisector / altitude).
 - (b) Based on the marked figure, Deja claims that the $\triangle ACD \cong \triangle \boxed{?}$ by (SAS / SSS / SSA / ASA / HL).
 - (c) Finally, Deja concludes that $\angle A \cong \angle \boxed{?}$, as they are corresponding parts of congruent triangles.
-

Problem 3 Prove that the base angles of an isosceles triangle are congruent.

- (a) Beginning with the given figure on the left, Elle draws \overline{CD} and marks the figure intending that this new segment is a(n) (median / angle bisector / perpendicular bisector / altitude).
 - (b) Based on the marked figure, Deja claims that the $\triangle ACD \cong \triangle \boxed{?}$ by (SAS / SSS / SSA / ASA / HL).
 - (c) Finally, Deja concludes that $\angle A \cong \angle \boxed{?}$, as they are corresponding parts of congruent triangles.
-

The Isosceles Triangle Theorem

Problem 4 Simon and Taylor are trying to prove that the base angles of an isosceles triangle are congruent.

Beginning with the given figure on the left, Simon draws \overline{CD} and marks the second figure intending that this new segment is a perpendicular bisector of \overline{AB} .

Taylor claims that a perpendicular bisector of a side of a triangle usually misses the opposite vertex. So without using properties of isosceles triangles, the figure must allow for that possibility.

Choose the best response to their argument:

Multiple Choice:

- (a) Simon is correct, and $\triangle ACD \cong \triangle BCD$ by SAS.
- (b) Simon is correct, and $\triangle ACD \cong \triangle BCD$ by SSS
- (c) Taylor is correct, and the perpendicular bisector cannot be used to complete this proof.
- (d) Neither of them are correct.

Problem 5 Prove that the base angles of an isosceles triangle are congruent.

The Isosceles Triangle Theorem

- (a) Examining the given figure on the left, Lissy notices symmetry in the triangle and claims that the triangle is congruent to itself by a (translation / reflection / rotation).
 - (b) Based on the marked figure, Lissy claims that the $\triangle ACB \cong \triangle \boxed{?}$ by (SAS / SSS / SSA / ASA / HL).
 - (c) Finally, Lissy concludes that $\angle A \cong \angle \boxed{?}$, as they are corresponding parts of congruent triangles.
-

Inscribed Angles

Proofs.

Problem 6 In the figure below, \overline{AB} is a diameter of a circle with center P . Prove that $\angle B$ is a right angle.

- (a) Beginning with the diagram on the left, Natalia draws \overline{PB} and marks the diagram to show segments that she knows to be congruent because each one is a ? of the circle.

- (b) Natalia sees that $\triangle APB$ and $\triangle BPC$ are ? triangles, so she marks the figure to show angles that must congruent.

Fixnote: Do we need a statement or citation of the theorem?

- (c) In order to do some algebra with these congruent angles, Natalia labels their measures x and y , as shown in the picture on the right.
- (d) She writes an equation for the sum of the angles of $\triangle ABC$:

$$\boxed{?} = 180^\circ$$

Fixnote: Need a prompt about dividing the equation by 2.

(e) Since $m\angle B = \boxed{?}$, she concludes that $m\angle B = 90^\circ$.

Fixnote: Should call it $\angle ABC$ because of the new segment. Or maybe note this earlier.

Problem 7 *Fixnote: New problem about relationship between inscribed angle and central angle.*

Part II

Math 2

Similar Right Triangles

Proofs.

Problem 8 *Adapted from Ohio's 2017 Geometry released item 17.*

Complete the following proof that $\triangle DAC$ is similar to $\triangle DBA$:

- (a) $\triangle ABC \sim \triangle \square$ by AA because they share $\angle B$ and they each have a right angle.
- (b) $\triangle ABC \sim \triangle \square$ by AA because they share $\angle C$ and they each have a right angle.
- (c) $\triangle DAC \sim \triangle \square$ because they are both similar to $\triangle ABC$.

*Fixnote: Need to prompt for AA in the first two steps.
The 2017 EOC item calls AA a postulate, which it is not.
Should AA be called a criterion? a theorem? a condition?*
