

# Set Theory Problems

*Short-answer problems about sets.*

**Question 1** What is your name?

**Free Response:**

---

**Problem 2** Given two sets  $X$  and  $Y$ , explain what is meant by  $X \cup Y$ .

**Free Response:** **Hint:**  $X \cup Y$  is the set of elements that are in  $X$  or in  $Y$  (or both, as the “or” is inclusive).

---

**Problem 3** Given two sets  $X$  and  $Y$ , explain what is meant by  $X \cap Y$ .

**Free Response:** **Hint:**  $X \cap Y$  is the set of elements that are in  $X$  and in  $Y$ .

---

**Problem 4** Given two sets  $X$  and  $Y$ , explain what is meant by  $X - Y$ .

**Free Response:** **Hint:**  $X - Y$  is the set of elements that are in  $X$  but not in  $Y$ .

---

**Problem 5** Explain the difference between the symbols  $\in$  and  $\subset$ .

**Free Response:** **Hint:** The notation  $X \in Y$  means that  $X$  is a single element in the set  $Y$ . In this case,  $X$  is probably not a set. The notation  $X \subset Y$  requires that both  $X$  and  $Y$  are sets and, furthermore, that every element of  $X$  is also in  $Y$ .

---

**Problem 6** How is  $\{\emptyset\}$  different from  $\emptyset$ ?

---

Learning outcomes:  
Author(s): Bart Snapp and Brad Findell

**Free Response:** **Hint:** The empty set,  $\emptyset$ , is a set that contains no elements. That is,  $\emptyset = \{\}$ . The set  $\{\emptyset\}$  contains one element that is itself a set—and that element happens to be the empty set. We could instead write  $\{\{\}\}$ , but that looks ugly.

**Problem 7** Draw a Venn diagram for the set of elements that are in  $X$  or  $Y$  but not both. How does it differ from the Venn diagram for  $X \cup Y$ ?

**Free Response:** **Hint:** Same as the Venn diagram for  $X \cup Y$ , except that the  $X \cap Y$  part is not shaded.

**Problem 8** If we let  $X$  be the set of “right triangles” and we let  $Y$  be the set of “equilateral triangles” does the picture below show the relationship between these two sets?

Explain your reasoning.

**Free Response:** **Hint:** Yes. The picture is accurate because no right triangles are also equilateral triangles.

**Problem 9** If  $X = \{1, 2, 3, 4, 5\}$  and  $Y = \{3, 4, 5, 6\}$  find:

- (a)  $X \cup Y$
- (b)  $X \cap Y$
- (c)  $X - Y$
- (d)  $Y - X$

**Free Response:** **Hint:** (a)  $X \cup Y = \{1, 2, 3, 4, 5, 6\}$   
 (b)  $X \cap Y = \{3, 4, 5\}$

- (c)  $X - Y = \{1, 2\}$   
 (d)  $Y - X = \{6\}$

**Problem 10** Let  $n\mathbb{Z}$  represent the integer multiples of  $n$ . So for example:

$$3\mathbb{Z} = \{\dots, -12, -9, -6, -3, 0, 3, 6, 9, 12, \dots\}$$

Compute the following:

- (a)  $3\mathbb{Z} \cap 4\mathbb{Z}$   
 (b)  $2\mathbb{Z} \cap 5\mathbb{Z}$   
 (c)  $3\mathbb{Z} \cap 6\mathbb{Z}$   
 (d)  $4\mathbb{Z} \cap 6\mathbb{Z}$   
 (e)  $4\mathbb{Z} \cap 10\mathbb{Z}$

In each case explain your reasoning.

**Free Response:** **Hint:** (a)  $3\mathbb{Z} \cap 4\mathbb{Z} = 12\mathbb{Z}$

- (b)  $2\mathbb{Z} \cap 5\mathbb{Z} = 10\mathbb{Z}$   
 (c)  $3\mathbb{Z} \cap 6\mathbb{Z} = 6\mathbb{Z}$   
 (d)  $4\mathbb{Z} \cap 6\mathbb{Z} = 12\mathbb{Z}$   
 (e)  $4\mathbb{Z} \cap 10\mathbb{Z} = 20\mathbb{Z}$

**Problem 11** Make a general rule for intersecting sets of the form  $n\mathbb{Z}$  and  $m\mathbb{Z}$ . Explain why your rule works.

**Free Response:** **Hint:** The intersection of two sets is what they have in common. The intersection of the set of multiples of  $n$  and the set of multiples of  $m$  are called common multiples (surprise!), and they are all multiples of the least common multiple of  $n$  and  $m$ .

**Problem 12** If  $X \cup Y = X$ , what can we say about the relationship between the sets  $X$  and  $Y$ ? Explain your reasoning.

**Free Response:** **Hint:**  $Y \subset X$  because every element of  $Y$  must already be in  $X$ .

**Problem 13** If  $X \cap Y = X$ , what can we say about the relationship between the sets  $X$  and  $Y$ ? Explain your reasoning.

**Free Response:** **Hint:**  $X \subset Y$  because every element of  $X$  must already be in  $Y$ .

---

**Problem 14** If  $X - Y = \emptyset$ , what can we say about the relationship between the sets  $X$  and  $Y$ ? Explain your reasoning.

**Free Response:** **Hint:**  $X \subset Y$  because that would mean  $X$  contains no elements that are not also in  $Y$ .

---
